Chapter 1

Introduction

This Chapter provides an overview of the Wireless Access Point's features and capabilities.

Congratulations on the purchase of your new Wireless Access Point. The Wireless Access Point links your 802.11g or 802.11b Wireless Stations to your wired LAN. The Wireless stations and devices on the wired LAN are then on the same network, and can communicate with each other without regard for whether they are connected to the network via a Wireless or wired connection.

Figure 1: Wireless Access Point

The auto-sensing capability of the Wireless Access Point allows packet transmission up to 54Mbps for maximum throughput, or automatic speed reduction to lower speeds when the environment does not permit maximum throughput.

Features of your Wireless Access Point

The Wireless Access Point incorporates many advanced features, carefully designed to provide sophisticated functions while being easy to use.

- **Standards Compliant.** The Wireless Router complies with the IEEE802.11g (DSSS) specifications for Wireless LANs.
 - **Supports both 802.11b and 802.11g Wireless Stations.** The 802.11g standard provides for backward compatibility with the 802.11b standard, so both 802.11b and 802.11g Wireless stations can be used simultaneously.
 - **108Mbps Wireless Connections.** On both the 2.4GHz (802.11b & 802.11g) and 5GHz (802.11a) bands, 108Mbps connections are available to compatible clients.
 - **Bridge Mode Support.** The Wireless Access Point can operate in Bridge Mode, connecting to another Access Point. Both PTP (Point to Point) and PTMP (Point to Multi-Point) Bridge modes are supported.
- And you can even use both Bridge Mode and Access Point Mode simultaneously!**
- **Client/Repeater Access Point.** The Wireless Access Point can operate as a Client or Repeater Access Point, sending all traffic received to another Access Point.
 - **Simple Configuration.** If the default settings are unsuitable, they can be changed quickly and easily.
 - **DHCP Client Support.** **D**ynamic **H**ost **C**onfiguration **P**rotocol provides a dynamic IP address to PCs and other devices upon request. The Wireless Access Point can act as a **DHCP Client**, and obtain an IP address and related information from your existing DHCP Server.
 - **Upgradeable Firmware.** **Firmware is stored in a flash memory and can be upgraded easily, using only your Web Browser.**

Security Features

- Security Profiles. For maximum flexibility, wireless security settings are stored in Security Profiles. Up to 8 Security profiles can be defined, and up to 4 used as any time.
- Multiple SSIDs. Because each Security Profile has its own SSID, and up to 4 Security Profiles can be active simultaneously, multiple SSIDs are supported. Different clients can connect to the Wireless Access Point using different SSIDs, with different security settings.
- Multiple SSID Isolation. If desired, PCs and devices connecting using different SSIDs can be isolated from each other.
- VLAN Support. The 802.1Q VLAN standard is supported, allowing traffic from different sources to be segmented. Combined with the multiple SSID feature, this provides a powerful tool to control access to your LAN.
- WEP support. Support for WEP (Wired Equivalent Privacy) is included. Both 64 Bit and 128 Bit keys are supported.
- WPA support. Support for WPA is included. WPA is more secure than WEP, and should be used if possible. Both TKIP and AES encryption methods are supported.
- 802.1x Support. **Support for 802.1x mode is included, providing for the industrial-strength wireless security of 802.1x authentication and authorization.**
- Radius Client Support. **The Wireless Access Point can login to your existing Radius Server (as a Radius client).**
- Radius MAC Authentication. **You can centralize the checking of Wireless Station MAC addresses by using a Radius Server.**
- Rogue AP Detection. **The Wireless Access Point can detect unauthorized (Rogue) Access Points on your LAN.**
- Access Control. The Access Control feature can check the MAC address of Wireless clients to ensure that only trusted Wireless Stations can use the Wireless Access Point to gain access to your LAN.
- Password - protected Configuration. Optional password protection is provided to prevent unauthorized users from modifying the configuration data and settings.

Advanced Features

- Auto Configuration. The Wireless Access Point can perform self-configuration by copying the configuration data from another Access Point. This feature is enabled by default.
- Auto Update. The Wireless Access Point can automatically update its firmware, by downloading and installing new firmware from your FTP server.
- Command Line Interface. If desired, the command line interface (CLI) can be used for configuration. This provides the possibility of creating scripts to perform common configuration changes.
- NetBIOS & WINS Support. Support for both NetBIOS broadcast and WINS (Windows Internet Naming Service) allows the Wireless Access Point to easily fit into your existing Windows network.
- Radius Accounting Support. If you have a Radius Server, you can use it to provide accounting data on Wireless clients.
- Syslog Support. If you have a Syslog Server, the Wireless Access Point can send its log data to your Syslog Server.
- SNMP Support. SNMP (Simple Network Management Protocol) is supported, allowing you to use a SNMP program to manage the Wireless Access Point.
- UAM Support. **The Wireless Access Point supports UAM (Universal Access Method), making it suitable for use in Internet cafes and other sites where user access time must be accounted for.**
- WDS Support. **Support for WDS (Wireless Distribution System) allows the Wireless Access Point to act as a Wireless Bridge. Both Point-to-Point and Multi-Point Bridge modes are supported.**

Package Contents

The following items should be included:

- Wireless Access Point

If any of the above items are damaged or missing, please contact your dealer immediately.

Physical Details

Front Panel LEDs

Figure 2: Front Panel

Status	On - Error condition. Off - Normal operation. Blinking - During start up, and when the Firmware is being upgraded.
Power	On - Normal operation. Off - No power
LAN	On - The LAN (Ethernet) port is active. Off - No active connection on the LAN (Ethernet) port. Flashing - Data is being transmitted or received via the corresponding LAN (Ethernet) port.
Wireless LAN	On - Idle Off - Error- Wireless connection is not available. Flashing - Data is being transmitted or received via the Wireless access point. Data includes "network traffic" as well as user data.

**Figure 3 Rear Panel****Antenna**

One antenna (aerial) is supplied. Best results are usually obtained with the antenna in a vertical position.

Console port

DB9 female RS232 port.

Reset Button

This button has two (2) functions:

- **Reboot.** When pressed and released, the Wireless Access Point will reboot (restart).
- **Reset to Factory Defaults.** This button can also be used to clear ALL data and restore ALL settings to the factory default values.

To Clear All Data and restore the factory default values:

1. Power Off the Access Point
2. Hold the Reset Button down while you Power On the Access Point.
3. Continue holding the Reset Button until the Status (Red) LED blinks TWICE.
4. Release the Reset Button.
The factory default configuration has now been restored, and the Access Point is ready for use.

Ethernet

Use a standard LAN cable (RJ45 connectors) to connect this port to a 10BaseT or 100BaseT hub on your LAN.

Power port

Connect the supplied power adapter here.

Chapter 3

Access Point Setup

This Chapter provides details of the Setup process for Basic Operation of your Wireless Access Point.

Overview

This chapter describes the setup procedure to make the Wireless Access Point a valid device on your LAN, and to function as an Access Point for your Wireless Stations.

Wireless Stations may also require configuration. For details, see *Chapter 4 - Wireless Station Configuration*. The Wireless Access Point can be configured using either the supplied Windows utility or your Web Browser

Setup using the Windows Utility

A simple Windows setup utility is supplied on the CD-ROM. This utility can be used to assign a suitable IP address to the Wireless Access Point. Using this utility is recommended, because it can locate the Wireless Access Point even if it has an invalid IP address.

Installation

5. Insert the supplied CD-ROM in your drive.
6. If the utility does not start automatically, run the SETUP program in the root folder.
7. Follow the prompts to complete the installation.

Main Screen

- Start the program by using the icon created by the setup program.
- When run, the program searches the network for all active Wireless Access Points, then lists them on screen, as shown by the example below.

Figure 4: Management utility Screen

Wireless Access Points

The main panel displays a list of all Wireless Access Points found on the network. For each Access Point, the following data is shown:

Server Name	The <i>Server Name</i> is shown on a sticker on the base of the device.
IP address	The IP address for the Wireless Access Point.
MAC Address	The hardware or physical address of the Wireless Access Point.
IEEE Standard	The wireless standard or standards used by the Wireless Access Point (e.g. 802.11b, 802.11g)
FW Version	The current Firmware version installed in the Wireless Access Point.

Description	Any extra information for the Wireless Access Point, entered by the administrator.

Note: If the desired Wireless Access Point is not listed, check that the device is installed and ON, then update the list by clicking the *Refresh* button.

Buttons

Refresh	Click this button to update the Wireless Access Point device listing after changing the name or IP Address.
Detail Info	When clicked, additional information about the selected Access Point will be displayed.
Web Management	Use this button to connect to the Wireless Access Point's Web-based management interface.
Set IP Address	Click this button if you want to change the IP Address of the Wireless Access Point.
Exit	Exit the Management utility program by clicking this button.

8. Select the desired Wireless Access Point.
9. Click the *Set IP Address* button.
10. If prompted, enter the user name and password. The default values are **admin** for the *User Name*, and **password** for the *Password*.
11. Ensure the *IP address*, *Network Mask*, and *Gateway* are correct for your LAN. Save any changes.
12. Click the *Web Management* button to connect to the selected Wireless Access Point using your Web Browser. If prompted, enter the *User Name* and *Password* again.
13. Check the following screens, and configure as necessary for your environment. Use the on-line help if necessary.
The later sections in this Chapter also provides more details about each of these screens.
 - **Access Control** - MAC level access control.
 - **Security Profiles** - Wireless security.
 - **System** - Identification, location, and Network settings
 - **Wireless** - Basic & Advanced
14. You may also wish to set the admin password and administration connection options. These are on the *Admin Login* screen accessed from the **Management** menu. See Chapter 6 for details of the screens and features available on the **Management** menu.
15. Use the **Apply/Restart** button on the menu to apply your changes and restart the Wireless Access Point.

Setup is now complete.

Wireless stations must now be set to match the Wireless Access Point. See Chapter 4 for details.

Setup using a Web Browser

Your Browser must support JavaScript. The configuration program has been tested on the following browsers:

- Netscape V4.08 or later
- Internet Explorer V4 or later

Setup Procedure

Before commencing, install the Wireless Access Point in your LAN, as described previously.

16. Check the Wireless Access Point to determine its *Default Name*. This is shown on a label on the base or rear, and is in the following format:
SCxxxxxx
Where xxxxxx is a set of 6 Hex characters (0 ~ 9, and A ~ F).
17. Use a PC which is already connected to your LAN, either by a wired connection or another Access Point.
 - Until the Wireless Access Point is configured, establishing a Wireless connection to it may be not possible.
 - If your LAN contains a Router or Routers, ensure the PC used for configuration is on the same LAN segment as the Wireless Access Point.
18. Start your Web browser.
19. In the *Address* box, enter HTTP:// and the *Default Name* of the Wireless Access Point
e.g.
HTTP://SC2D631A
20. You should then see a login prompt, which will ask for a *User Name* and *Password*.
Enter **admin** for the *User Name*, and **password** for the *Password*.
These are the default values. The password can and should be changed. Always enter the current user name and password, as set on the *Admin Login* screen.

Figure 5: Password Dialog

21. You will then see the *Status* screen, which displays the current settings and status. No data input is possible on this screen. See Chapter 5 for details of the *Status* screen.

From the menu, check the following screens, and configure as necessary for your environment. Details of these screens and settings are described in the following sections of this chapter.

- **Access Control** - MAC level access control.
 - **Security Profiles** - Wireless security.
 - **System** - Identification, location, and Network settings
 - **Wireless** - Basic & Advanced
22. You may also wish to set the admin password and administration connection options. These are on the *Admin Login* screen accessed from the **Management** menu. See Chapter 6 for details of the screens and features available on the **Management** menu.
23. Use the **Apply/Restart** button on the menu to apply your changes and restart the Wireless Access Point.

Setup is now complete.

Wireless stations must now be set to match the Wireless Access Point. See Chapter 4 for details.

If you can't connect:

It is likely that your PC's IP address is incompatible with the Wireless Access Point's IP address. This can happen if your LAN does not have a DHCP Server. The default IP address of the Wireless Access Point is 192.168.0.228, with a Network Mask of 255.255.255.0.

If your PC's IP address is not compatible with this, you must change your PC's IP address to an unused value in the range 192.168.0.1 ~ 192.168.0.254, with a Network Mask of 255.255.255.0. See **Appendix C - Windows TCP/IP** for details for this procedure.

Access Control

This feature can be used to block access to your LAN by unknown or untrusted wireless stations. Click *Access Control* on the menu to view a screen like the following.

Figure 6: Access Control Screen

Data - Access Control Screen

Enable	Use this checkbox to Enable or Disable this feature as desired. Warning ! Ensure your own PC is in the "Trusted Wireless Stations" list before enabling this feature.
Trusted Stations	This table lists any Wireless Stations you have designated as "Trusted". If you have not added any stations, this table will be empty. For each Wireless station, the following data is displayed: • MAC Address - the MAC or physical address of each Wireless station. • Connected - this indicates whether or not the Wireless station is currently associates with this Access Point.
Buttons	
Modify List	To change the list of Trusted Stations (Add, Edit, or Delete a Wireless Station or Stations), click this button. You will then see the <i>Trusted Wireless Stations</i> screen, described below.
Read from File	To upload a list of Trusted Stations from a file on your PC, click this button.
Write to File	To download the current list of Trusted Stations from the Access Point to a file on your PC, click this button.

To change the list of trusted wireless stations, use the *Modify List* button on the *Access Control* screen. You will see a screen like the sample below.

Figure 7: Trusted Wireless Stations

Data - Trusted Wireless Stations

Trusted Stations	Wireless	This lists any Wireless Stations which you have designated as "Trusted".
Other Stations	Wireless	This list any Wireless Stations detected by the Access Point, which you have not designated as "Trusted".
Name		The name assigned to the Trusted Wireless Station. Use this when adding or editing a Trusted Station.
Address		The MAC (physical) address of the Trusted Wireless Station. Use this when adding or editing a Trusted Station.

Buttons

<<	Add a Trusted Wireless Station to the list (move from the "Other Stations" list). - Select an entry (or entries) in the "Other Stations" list, and click the "<<" button. - Enter the Address (MAC or physical address) of the wireless station, and click the "Add" button.
>>	Delete a Trusted Wireless Station from the list (move to the "Other Stations" list). - Select an entry (or entries) in the "Trusted Stations" list. - Click the ">>" button.
Select All	Select all of the Stations listed in the "Other Stations" list.
Select None	De-select any Stations currently selected in the "Other Stations" list.
Edit	To change an existing entry in the "Trusted Stations" list, select it and click this button. 24. Select the Station in the "Trusted Station" list. 25. Click the "Edit" button. The address will be copied to the "Address" field, and the "Add" button will change to "Update". 26. Edit the address (MAC or physical address) as required. 27. Click "Update" to save your changes.
Add	To add a Trusted Station which is not in the "Other Wireless Stations" list, enter the required data and click this button.

Security Profiles

Security Profiles contain the SSID and all the security settings for Wireless connections to this Access Point.

- Up to eight (8) Security Profiles can be defined.
- Up to four (4) Security Profiles can be enabled at one time, allowing up to 4 different SSIDs to be used simultaneously.

Figure 8: Security Profiles Screen

Data - Security Profiles Screen

Profile	
Profile List	All available profiles are listed. For each profile, the following data is displayed: • * If displayed before the name of the profile, this indicates the profile is currently enabled. If not displayed, the profile is currently disabled. • Profile Name The current profile name is displayed. • [SSID] The current SSID associated with this profile. • Security System The current security system (e.g. WPA-PSK) is displayed. • [Band] The Wireless Band (2.4 GHz, 5GHz) for this profile is displayed. Profiles may be assigned to either or both Wireless Bands.
Buttons	• Enable - Enable the selected profile. • Configure - Change the settings for the selected profile. • Disable - Disable the selected profile.

Primary Profile	
802.11b/g AP Mode	Select the primary profile for 802.11b and 802.11g (2.4 GHz band) AP mode. Only enabled profiles are listed. The SSID associated with this profile will be broadcast if the "Broadcast SSID" setting on the Basic screen is enabled.
802.11b/g Bridge Mode	Select the primary profile for 802.11b and 802.11g (2.4 GHz band) Bridge Mode. This setting determines the SSID and security settings used for the Bridge connection to the remote AP.
Isolation	
None	If this option is selected, wireless clients using different profiles (different SSIDs) are not isolated from each other, so they will be able to communicate with each other.
Isolate all	If this option is selected, wireless clients using different profiles (different SSIDs) are isolated from each other, so they will NOT be able to communicate with each other. They will still be able to communicate with other clients using the same profile, unless the "Wireless Separation" setting on the "Advanced" screen has been enabled.
Use VLAN	This option is only useful if the hubs/switches on your LAN support the VLAN (802.1Q) standard. When VLAN is used, you must select the desired VLAN for each security profile when configuring the profile. (If VLAN is not selected, the VLAN setting for each profile is ignored.) Click the "Configure VLAN" button to configure the IDs used by each VLAN.

Security Profile Screen

This screen is displayed when you select a Profile on the Security Profiles screen, and click the *Configure* button.

The screenshot shows the 'Security Profile' configuration screen. It has a green header with the title 'Security Profile'. On the left is a green sidebar with navigation links: 'Profile', 'Security System', 'Security Settings', 'Radius MAC Authentication', and 'UAM'. The main content area is white and contains the following fields:

- Profile Name:** A text input field containing 'wireless'.
- SSID:** A text input field containing 'wireless'.
- Wireless Band:** A dropdown menu currently set to '2.4 GHz'.
- Wireless Security System:** A dropdown menu currently set to 'None'.
- Radius MAC Authentication:** A section with 'Current Status: Disabled' and a 'Configure' button.
- UAM:** A section with 'Current Status: Disabled' and a 'Configure' button.

At the bottom of the screen are four buttons: 'Back', 'Save', 'Cancel', and 'Help'.

Figure 9: Security Profile Screen

Profile Data

Enter the desired settings for each of the following:

Profile Name	Enter a suitable name for this profile.
SSID	Enter the desired SSID. Each profile must have a unique SSID.
Wireless Band	Select the wireless band or bands for this profile. If your Wireless Access Point only has a single band, then only 1 option is available.

Select the desired option, and then enter the settings for the selected method.

The available options are:

- **None** - No security is used. Anyone using the correct SSID can connect to your network.
- **WEP** - The 802.11b standard. Data is encrypted before transmission, but the encryption system is not very strong.
- **WPA-PSK** - Like WEP, data is encrypted before transmission. WPA is more secure than WEP, and should be used if possible. The PSK (Pre-shared Key) must be entered on each Wireless station. The 256Bit encryption key is derived from the PSK, and changes frequently.
- **WPA-802.1x** - This version of WPA requires a Radius Server on your LAN to provide the client authentication according to the 802.1x standard. Data transmissions are encrypted using the WPA standard.

If this option is selected:

- This Access Point must have a "client login" on the Radius Server.
 - Each user must have a "user login" on the Radius Server.
 - Each user's wireless client must support 802.1x and provide the login data when required.
 - All data transmission is encrypted using the WPA standard. Keys are automatically generated, so no key input is required.
- **802.1x** - This uses the 802.1x standard for client authentication, and WEP for data encryption. If possible, you should use WPA-802.1x instead, because WPA encryption is much stronger than WEP encryption.

If this option is selected:

- This Access Point must have a "client login" on the Radius Server.
- Each user must have a "user login" on the Radius Server.
- Each user's wireless client must support 802.1x and provide the login data when required.
- All data transmission is encrypted using the WEP standard. You only have to select the WEP key size; the WEP key is automatically generated.

Figure 10: Wireless Security - None

No security is used. Anyone using the correct SSID can connect to your network.

The only settings available from this screen are **Radius MAC Authentication** and **UAM** (Universal Access Method).
Radius MAC Authentication

Radius MAC Authentication provides for MAC address checking which is centralized on your Radius server. If you don't have a Radius Server, you cannot use this feature.

Using MAC authentication

28. Ensure the Wireless Access Point can login to your Radius Server.

- Add a RADIUS client on the RADIUS server, using the IP address or name of the Wireless Access Point, and the same shared key as entered on the Wireless Access Point.
- Ensure the Wireless Access Point has the correct address, port number, and shared key for login to your Radius Server. These parameters are entered either on the **Security** page, or the **Radius-based MAC authentication** sub-screen, depending on the security method used.
- On the Access Point, enable the Radius-based MAC authentication feature on the screen below.

29. Add Users on the Radius server as required. The username must be the MAC address of the Wireless client you wish to allow, and the password must be blank.

30. When clients try to associate with the Access Point, their MAC address is passed to the Radius Server for authentication.

- If successful, "xx:xx:xx:xx:xx:xx MAC authentication" is entered in the log, and client station status would show as "authenticated" on the station list table;
- If not successful, "xx:xx:xx:xx:xx:xx MAC authentication failed" is entered in the log, and station status is shown as "authenticating" on the station list table.

Radius-based MAC authentication Screen

This screen will look different depending on the current security setting. If you have already provided the details of your Radius server, you won't be prompted for it again. Otherwise, you must enter the details of your Radius Server on this screen.

Radius-based MAC Authentication

☐ Enable Radius-based MAC authentication

Radius Server Address:

Radius Port:

Client Login Name:

Shared Key:

Figure 11: Radius-based MAC Authentication Screen

Data - Radius-based MAC Authentication Screen

Enable ...	Enable this if you wish to Radius-based MAC authentication.
Radius Server Address	If this field is visible, enter the name or IP address of the Radius Server on your network.
Radius Port	If this field is visible, enter the port number used for connections to the Radius Server.
Client Login Name	If this field is visible, it displays the name used for the Client Login on the Radius Server. This Login name must be created on the Radius Server.
Shared Key	If this field is visible, it is used for the Client Login on the Radius Server. Enter the key value to match the value on the Radius Server.
WEP Key	If this field is visible, it is for the WEP key used to encrypt data transmissions to the Radius Server. Enter the desired key value in HEX, and ensure the Radius Server has the same value.
WEP Key Index	If this field is visible, select the desired key index. Any value can be used, provided it matches the value on the Radius Server.

UAM (Universal Access Method) is intended for use in Internet cafes, Hot Spots, and other sites where the Access Point is used to provide Internet Access.

If enabled, then HTTP (TCP, port 80) connections are checked. (UAM only works on HTTP connections; all other traffic is ignored.) If the user has not been authenticated, Internet access is blocked, and the user is re-directed to another web page. Typically, this web page is on your Web server, and explains how to pay for and obtain Internet access.

To use UAM, you need a Radius Server for Authentication. The "Radius Server Setup" must be completed before you can use UAM. The required setup depends on whether you are using "Internal" or "External" authentication.

- **Internal authentication** uses the web page built into the Wireless Access Point.
- **External authentication** uses a web page on your Web server. Generally, you should use External authentication, as this allows you to provide relevant and helpful information to users.

UAM authentication - Internal

31. Ensure the Wireless Access Point can login to your Radius Server.
 - Add a RADIUS client on RADIUS server, using the IP address or name of the Wireless Access Point, and the same shared key as entered on the Wireless Access Point.
 - Ensure the Wireless Access Point has the correct address, port number, and shared key for login to your Radius Server. These parameters are entered either on the Security page, or the UAM sub-screen, depending on the security method used.
32. Add users on your RADIUS server as required, and allow access by these users.
33. Client PCs must have the correct Wireless settings in order to associate with the Wireless Access Point.
34. When an associated client tries to use HTTP (TCP, port 80) connections, they will be re-directed to a user login page.
35. The client (user) must then enter the user name and password, as defined on the Radius Server. (You must provide some system to let users know the correct name and password to use.)
36. If the user name and password is correct, Internet access is allowed. Otherwise, the user remains on the login page.
 - Clients which pass the authentication are listed as "xx:xx:xx:xx:xx:xx WEB authentication" in the log table, and station status would show as "Authenticated" on the station list table.
 - If a client fails authentication, "xx:xx:xx:xx:xx:xx WEB authentication failed" shown in the log, and station status is shown as "Authenticating" on the station list table.

UAM authentication - External

37. Ensure the Wireless Access Point can login to your Radius Server.
 - Add a RADIUS client on RADIUS server, using the IP address or name of the Wireless Access Point, and the same shared key as entered on the Wireless Access Point.
 - Ensure the Wireless Access Point has the correct address, port number, and shared key for login to your Radius Server. These parameters are entered either on the Security page, or the UAM sub-screen, depending on the security method used.
38. On your Web Server, create a suitable welcome page.
The welcome page must have a link or button to allow the user to input their user name and password on the uamlogin.htm page on the Access Point.
39. On the Access Point's **UAM** screen, select **External Web-based Authentication**, and enter the **URL** for the welcome page on your Web server.
40. Add users on your RADIUS server as required, and allow access by these users.
41. Client PCs must have the correct Wireless settings in order to associate with the Wireless Access Point.
42. When an associated client tries to use HTTP (TCP, port 80) connections, they will be re-directed to the welcome page on your Web Server. They must then click the link or button in order to reach the Access Point's login page.
43. The client (user) must then enter the user name and password, as defined on the Radius Server. (You must provide some system to let users know the correct name and password to use.)
44. If the user name and password is correct, Internet access is allowed. Otherwise, the user remains on the login page.

- Clients which pass the authentication are listed as “xx:xx:xx:xx:xx:xx WEB authentication” in the log table, and station status would show as “Authenticated” on the station list table.
- If a client fails authentication, “xx:xx:xx:xx:xx:xx WEB authentication failed” is shown in the log, and station status is shown as “Authenticating” on the station list table.

UAM Screen

The UAM screen will look different depending on the current security setting. If you have already provided the address of your Radius server, you won't be prompted for it again.

Figure 12: UAM Screen

Data - UAM Screen

Enable	Enable this if you wish to use this feature. See the section above for details of using UAM.
Internal Web-based Authentication	If selected, then when a user first tries to access the Internet, they will be blocked, and re-directed to the built-in login page. The login data is then sent to the Radius Server for authentication.
External Web-based Authentication	If selected, then when a user first tries to access the Internet, they will be blocked, and re-directed to the URL below. This needs to be on your own local Web Server. The page must also link back to the built-in login page on this device to complete the login procedure.
Login URL	Enter the URL of the page on your local Web Server you wish users to see when they attempt to access the Internet, but are not logged in.
Login Failure URL	Enter the URL of the page on your local Web Server you wish users to see if their login fails. (This may be the same URL as the Login URL).

Security Settings - WEP

This is the 802.11b standard. Data is encrypted before transmission, but the encryption system is not very strong.

Security Profile

Profile	Profile Name:	wireless
	SSID:	wireless
	Wireless Band:	2.4 GHz
Security System	Wireless Security System:	WEP

	Key 3:	
	Key 4:	
	Passphrase:	Generate Key
Radius MAC Authentication	Current Status:	Disabled Configure
	UAM	Current Status: Disabled Configure
Back Save Cancel Help		

Figure 13: WEP Wireless Security

Data - WEP Screen

WEP	
Data Encryption	Select the desired option, and ensure your Wireless stations have the same setting: 64 Bit Encryption - Keys are 10 Hex (5 ASCII) characters. 128 Bit Encryption - Keys are 26 Hex (13 ASCII) characters. 152 Bit Encryption - Keys are 32 Hex (16 ASCII) characters.
Authentication	Normally, you can leave this at "Automatic", so that Wireless Stations can use either method ("Open System" or "Shared Key"). If you wish to use a particular method, select the appropriate value - "Open System" or "Shared Key". All Wireless stations must then be set to use the same method.
Key Input	Select "Hex" or "ASCII" depending on your input method. (All keys are converted to Hex, ASCII input is only for convenience.)
Key Value	Enter the key values you wish to use. The default key, selected by the radio button, is required. The other keys are optional. Other stations must have matching key values.
Passphrase	Use this to generate a key or keys, instead of entering them directly. Enter a word or group of printable characters in the Passphrase box and click the "Generate Key" button to automatically configure the WEP Key(s).
Radius MAC Authentication	The current status is displayed. Click the "Configure" button to configure this feature if required.

UAM	The current status is displayed. Click the "Configure" button to configure this feature if required.
------------	---

Like WEP, data is encrypted before transmission. WPA is more secure than WEP, and should be used if possible. The PSK (Pre-shared Key) must be entered on each Wireless station. The 256Bit encryption key is derived from the PSK, and changes frequently.

UAM
 Current Status: Disabled

Figure 14: WPA-PSK Wireless Security

Data - WPA-PSK Screen

WPA-PSK	
Network Key	Enter the key value. Data is encrypted using a 256Bit key derived from this key. Other Wireless Stations must use the same key.
WPA Encryption	Select the desired option. Other Wireless Stations must use the same method. TKIP - Unicast (point-to-point) transmissions are encrypted using TKIP, and multicast (broadcast) transmissions are not encrypted. TKIP + 64 bit WEP - Unicast (point-to-point) transmissions are encrypted using TKIP, and multicast (broadcast) transmissions are encrypted using 64 bit WEP. TKIP + 128 bit WEP - Unicast (point-to-point) transmissions are encrypted using TKIP, and multicast (broadcast) transmissions are encrypted using 128 bit WEP. AES - CCMP - CCMP is the most common sub-type of AES (Advanced Encryption System). Most systems will simply say "AES". If selected, both Unicast (point-to-point) and multicast (broadcast) transmissions are encrypted using AES. AES - TKIP - If selected, Unicast (point-to-point) uses

	AES-CCMP and multicast (broadcast) transmissions are encrypted using TKIP.
Pairwise Key Update	This refers to the key used for point-to-point transmissions. Enable this if you want the keys to be updated regularly.
Key Lifetime	This field determines how often Pairwise keys are dynamically updated. Enter the desired value.
Group Key Update	This refers to the key used for broadcast transmissions. Enable this if you want the keys to be updated regularly.
Key Lifetime	This field determines how often the Group key is dynamically updated. Enter the desired value.
Update Group key when membership terminates	If enabled, the Group key will be updated whenever any member leaves the group or disassociates from the Access Point.
Radius MAC Authentication	The current status is displayed. This will always be "Disabled", because Radius MAC Authentication is not available with WPA-PSK. The <i>Configure</i> button for this feature will also be disabled.
UAM	The current status is displayed. This will always be "Disabled", because UAM is not available with WPA-PSK. The <i>Configure</i> button for this feature will also be disabled.

System Screen

Click *System* on the menu to view a screen like the following.

System

Identification	Access Point Name: SC000012 Description: Country or Domain: -- Select One -- MAC Address: 00:C0:02:00:00:12
IP Address	☒ DHCP Client ☐ Fixed IP Address IP address: 172 . 31 . 2 . 191 Subnet Mask: 255 . 255 . 255 . 0 Gateway: 172 . 31 . 2 . 252 DNS: 172 . 31 . 2 . 239
WINS	☐ Enable WINS WINS Server Name/IP Address: 172.31.2.239

Figure 15: System Screen

Data - System Screen

Identification		
Access Point Name	Point	Enter a suitable name for this Access Point.
Description		If desired, you can enter a description for the Access Point.
Country Domain		Select the country or domain matching your current location.
IP Address		
DHCP Client		Select this option if you have a DHCP Server on your LAN, and you wish the Access Point to obtain an IP address automatically.
Fixed		If selected, the following data must be entered. IP Address - The IP Address of this device. Enter an unused IP address from the address range on your LAN. Subnet Mask - The Network Mask associated with the IP Address above. Enter the value used by other devices on your LAN. Gateway - The IP Address of your Gateway or Router. Enter the value used by other devices on your LAN. DNS - Enter the DNS (Domain Name Server) used by PCs on your LAN.
WINS		
Enable WINS		If your LAN has a WINS server, you can enable this to have this AP register with the WINS server.
WINS Server Name/IP Address		Enter the name or IP address of your WINS server.

Wireless Screens

There are two (2) configuration screens available:

- Basic Settings
- Advanced

Basic Settings Screen

The settings on this screen must match the settings used by Wireless Stations.
Click **Basic** on the menu to view a screen like the following.

Basic Settings - 2.4 GHz

Operation

Wireless Mode:

AP Mode:

Repeater AP

MAC Address:

☒ Broadcast SSID

Bridge Mode:

PTP Bridge AP

MAC Address:

☐ In PTMP mode, only allow specified APs

Parameters

Channel No:

Current Channel No: 1

Figure 16: Basic Settings Screen

Data - Basic Settings Screen

Operation

Wireless Mode

Select the desired option:

- **Disable** - select this if for some reason you do not this AP to transmit or receive at all.
- **802.11b and 802.11g** - this is the default, and will allow connections by both 802.11b and 802.11g wireless stations.
- **802.11b** - if selected, only 802.11b connections are allowed. 802.11g wireless stations will only be able to connect if they are fully backward-compatible with the 802.11b standard.
- **802.11g** - only 802.11g connections are allowed. If you only have 802.11g, selecting this option may provide a performance improvement over using the default setting.
- **Dynamic Super 802.11g (108Mbps)** - This uses *Packet Bursting, FastFrame, Compression, and Channel Bonding* (using 2 channels) to increase throughput. Only clients supporting the "Atheros Super G" mode can connect at 108Mbps, and they will only use this speed when necessary. However, this option is backward-compatible with 802.11b and (standard) 802.11g.
- **Static Super 802.11g (108Mbps)** - This uses *Packet Bursting, FastFrame, Compression, and Channel Bonding* (using 2 channels) to increase throughput.
Because "Channel Bonding" is always used, this method is NOT compatible with 802.11b and (standard) 802.11g.
Only clients supporting the "Atheros Super G" mode can connect at 108Mbps; they will always connect at this speed.

	Select this option only if all wireless stations support this "Atheros Super G" mode.
AP Mode	Both Bridge mode and AP mode can be used simultaneously, unless AP mode is "Client/Repeater". Select the desired AP mode: • None (disable) - Disable AP mode. Use this if you want to act a Bridge only. • Access Point - operate as a normal Access Point • Client/Repeater - act as a client or repeater for another Access Point. If selected, you must provide the address (MAC address) of the other AP in the Repeater AP MAC Address field. In this mode, all traffic is sent to the specified AP. Note: If using Client/Repeater mode, you cannot use Bridge Mode.
Repeater AP MAC Address	This is not required unless the AP Mode is "Client/Repeater". In this mode, you must provide the MAC address of the other AP in this field. You can either enter the MAC address directly, or, if the other AP is on-line and broadcasting its SSID, you can click the "Select AP" button and select from a list of available APs.
Broadcast SSID	If Disabled, no SSID is broadcast. If enabled, you must select the security profile whose SSID is to be broadcast. This can be done the "Security Profiles" screen. The SSID will then be broadcast to all Wireless Stations. Stations which have no SSID (or a "null" value) can then adopt the correct SSID for connections to this Access Point.
Bridge Mode	Both Bridge mode and AP mode can be used simultaneously, unless AP mode is "Client/Repeater". Select the desired Bridge mode: None (disable) - Disable Bridge mode. Use this if you want to act a AP only. Point-to-Point Bridge (PTP) - Bridge to a single AP. You must provide the MAC address of the other AP in the PTP Bridge AP MAC Address field. Point-to-Multi-Point Bridge (PTMP) - Select this only if this AP is the "Master" for a group of Bridge-mode APs. The other Bridge-mode APs must be set to Point-to-Point Bridge mode, using this AP's MAC address. They then send all traffic to this "Master". If required, you can specify the MAC addresses of the APs which are allowed to connect to this AP in PTMP mode. To specify the allowed APs: 45. Enable the checkbox "In PTMP mode, only allow specified APs". Click the button "Set PTMP APs". On the resulting sub-screen, enter the MAC addresses of the allowed APs.
PTP Bridge AP MAC Address	This is not required unless the Bridge Mode is "Point-to-Point Bridge (PTP)". In this case, you must enter the MAC address of the other AP in this field.
In PTMP mode, only allow specified APs	This is only functional if using Point-to-Multi-Point Bridge (PTMP) mode. If enabled, you can specify the MAC addresses of the APs which are allowed to connect to this AP. To specify the allowed APs: 46. Enable this checkbox Click the button "Set PTMP APs". On the resulting sub-screen, enter the MAC addresses of the allowed APs.
Set PTMP APs	Use this to open a sub-window where you can specify the MAC addresses of the APs which are allowed to connect to this AP. This is only functional if using Point-to-Multi-Point Bridge (PTMP) mode and you have enabled the checkbox "In PTMP mode, only allow specified APs".

Parameters

Channel No	• If "Automatic" is selected, the Access Point will select the best available Channel. • If you experience interference (shown by lost connections and/or slow data transfers) you may need to experiment with manually setting different channels to see which is the best.
Current Channel No.	This displays the current channel used by the Access Point.

Advanced Settings

Clicking the *Advanced* link on the menu will result in a screen like the following.

Advanced Settings - 2.4 GHz

Basic Rate	Basic Rate Selection: 802.11b (1, 2, 5.5, 11 Mbps)
Options	☐ Wireless Separation ☐ Worldwide Mode (802.11d)
Parameters	Disassociated Timeout: 5 Minutes (1 ~ 99) Fragmentation Length: 2346 (256 ~ 2346; Default 2346) Beacon Interval: 100 (20 ~ 1000; Default 100) RTS/CTS Threshold: 2346 (256 ~ 2346; Default 2346) Preamble Type: Long Output Power Level: Full Antenna Selection: Primary
802.11b	Protection Type: ☒ CTS-only ☐ RTS-CTS Short Slot Time: ☒ Enable ☐ Disable Protection Mode: Auto Protection Rate: 11 Mbps
Save Cancel Help	

Figure 17: Advanced Settings

Data - Advanced Settings Screen

Basic Rate	
Basic Rate	The Basic Rate is used for broadcasting. It does not determine the data transmission rate, which is determined by the "Mode" setting on the Basic screen. Select the desired option. Do NOT select the "802.11g" or "OFDM" options unless ALL of your wireless clients support this. 802.11b clients will not be able to connect to the Access Point if either of these modes is selected.
Options	
Wireless Separation	If enabled, then each Wireless station using the Access Point is invisible to other Wireless stations. In most business situations, this setting should be Disabled.
Worldwide Mode (802.11d)	Enable this setting if you wish to use this mode, and your Wireless stations support this mode.
Parameters	
Disassociated Timeout	This determines how quickly a Wireless Station will be considered "Disassociated" with this AP, when no traffic is received. Enter the desired time period.
Fragmentation	Enter the preferred setting between 256 and 2346. Normally, this can be left at the default value.
Beacon Interval	Enter the preferred setting between 20 and 1000. Normally, this can be left at the default value.
RTS/CTS Threshold	Enter the preferred setting between 256 and 2346. Normally, this can be left at the default value.
Preamble Type	Select the desired option. The default is "Long". The "Short" setting takes less time when used in a good environment.

Output Power Level	Select the desired power output. Higher levels will give a greater range, but are also more likely to cause interference with other devices.
Antenna Selection	If your Access Point has only 1 antenna, there is only 1 option available. If your Access Point has 2 antennae, select the option which gives the best results in your location.
802.11b	
Protection Type	Select the desired option. The default is CTS-only.
Short Slot Time	Enable or disable this setting as required.
Protection Mode	The Protection system is intended to prevent older 802.11b devices from interfering with 802.11g transmissions. (Older 802.11b devices may not be able to detect that a 802.11g transmission is in progress.) Normally, this should be left at "Auto".
Protection Rate	Select the desired option. The default is 11 Mbps.

This Chapter details the PC Configuration required for each PC on the local LAN.

Overview

All Wireless Stations need to have settings which match the Wireless Access Point. These settings depend on the mode in which the Access Point is being used.

- If using WEP or WPA-PSK, it is only necessary to ensure that each Wireless station's settings match those of the Wireless Access Point, as described below.
- For WPA-802.1x and 802.1x modes, configuration is much more complex. The Radius Server must be configured correctly, and setup of each Wireless station is also more complex.

Using WEP

For each of the following items, each Wireless Station must have the same settings as the Wireless Access Point.

Mode	On each PC, the mode must be set to Infrastructure .
SSID (ESSID)	This must match the value used on the Wireless Access Point. The default value is wireless Note! The SSID is case sensitive.
Wireless Security	• Each Wireless station must be set to use WEP data encryption. • The Key size (64 bit, 128 bit, 152 bit) must be set to match the Access Point. • The keys values on the PC must match the key values on the Access Point. Note: On some systems, the key sizes may be shown as 40bit, 104bit, and 128bit instead of 64 bit, 128 bit and 152bit. This difference arises because the key input by the user is 24 bits less than the key size used for encryption.

Using WPA-802.1x

This is the most secure and most complex system.

802.1x mode provides greater security and centralized management, but it is more complex to configure.

Wireless Station Configuration

For each of the following items, each Wireless Station must have the same settings as the Wireless Access Point.

Mode	On each PC, the mode must be set to Infrastructure .
SSID (ESSID)	This must match the value used on the Wireless Access Point. The default value is wireless Note! The SSID is case sensitive.
802.1x Authentication	Each client must obtain a Certificate which is used for authentication for the Radius Server.
802.1x Encryption	Typically, EAP-TLS is used. This is a dynamic key system, so keys do NOT have to be entered on each Wireless station. However, you can also use a static WEP key (EAP-MD5); the Wireless Access Point supports both methods simultaneously.

Radius Server Configuration

If using **WPA-802.1x** mode, the Radius Server on your network must be configured as follow:

- It must provide and accept **Certificates** for user authentication.
- There must be a **Client Login** for the Wireless Access Point itself.
 - The Wireless Access Point will use its Default Name as its Client Login name. (However, your Radius server may ignore this and use the IP address instead.)
 - The *Shared Key*, set on the *Security Screen* of the Access Point, must match the *Shared Secret* value on the Radius Server.
- **Encryption** settings must be correct.

802.1x Server Setup (Windows 2000 Server)

This section describes using *Microsoft Internet Authentication Server* as the Radius Server, since it is the only Radius Server available that supports the EAP-TLS authentication method.

The following services on the Windows 2000 Domain Controller (PDC) are also required:

- dhcpd
- dns
- rras
- webserver (IIS)
- Radius Server (Internet Authentication Service)
- Certificate Authority

Windows 2000 Domain Controller Setup

47. Run *dcpromo.exe* from the command prompt.

48. Follow all of the default prompts, ensure that DNS is installed and enabled during installation.

Services Installation

49. Select the *Control Panel - Add/Remove Programs*.

50. Click *Add/Remove Windows Components* from the left side.

51. Ensure that the following components are activated (selected):

- *Certificate Services*. After enabling this, you will see a warning that the computer cannot be renamed and joined after installing certificate services. Select *Yes* to select certificate services and continue
- *World Wide Web Server*. Select *World Wide Web Server* on the *Internet Information Services (IIS)* component.
- From the *Networking Services* category, select *Dynamic Host Configuration Protocol (DHCP)*, and *Internet Authentication Service* (DNS should already be selected and installed).

Figure 18: Components Screen

52. Click *Next*.

53. Select the *Enterprise root CA*, and click *Next*.

Figure 19: Certification Screen

54. Enter the information for the Certificate Authority, and click *Next*.

Figure 20: CA Screen

55. Click *Next* if you don't want to change the CA's configuration data.

56. Installation will warn you that Internet Information Services are running, and must be stopped before continuing. Click *Ok*, then *Finish*.

DHCP server configuration

57. Click on the *Start - Programs - Administrative Tools - DHCP*

58. Right-click on the server entry as shown, and select *New Scope*.

Figure 21: DHCP Screen

59. Click *Next* when the New Scope Wizard Begins.
60. Enter the name and description for the scope, click *Next*.
61. Define the IP address range. Change the subnet mask if necessary. Click *Next*.

Figure 22:IP Address Screen

62. Add exclusions in the address fields if required. If no exclusions are required, leave it blank. Click *Next*.
63. Change the *Lease Duration* time if preferred. Click *Next*.
64. Select *Yes, I want to configure these options now*, and click *Next*.
65. Enter the router address for the current subnet. The router address may be left blank if there is no router. Click *Next*.
66. For the Parent domain, enter the domain you specified for the domain controller setup, and enter the server's address for the IP address. Click *Next*.

New Scope Wizard

Domain Name and DNS Servers
The Domain Name System (DNS) maps and translates domain names used by clients on your network.

You can specify the parent domain you want the client computers on your network to use for DNS name resolution.

Parent domain:

To configure scope clients to use DNS servers on your network, enter the IP addresses for those servers.

Server name:	IP address:	
	192.168.0.250	Add
Resolve		Remove
		Up
		Down

< Back Next > Cancel

Figure 23: DNS Screen

67. If you don't want a WINS server, just click *Next*.
68. Select *Yes, I want to activate this scope now*. Click *Next*, then *Finish*.
69. Right-click on the server, and select *Authorize*. It may take a few minutes to complete.

70. Select *Start - Programs - Administrative Tools - Certification Authority*.

71. Right-click *Policy Settings*, and select *New - Certificate to Issue*.

Figure 24: Certificate Authority Screen

72. Select *Authenticated Session* and *Smartcard Logon* (select more than one by holding down the Ctrl key). Click *OK*.

Figure 25: Template Screen

73. Select *Start - Programs - Administrative Tools - Active Directory Users and Computers*.

74. Right-click on your active directory domain, and select *Properties*.

Figure 26: Active Directory Screen

75. Select the *Group Policy* tab, choose *Default Domain Policy* then click *Edit*.

Figure 27: Group Policy Tab

76. Select *Computer Configuration - Windows Settings - Security Settings - Public Key Policies*, right-click *Automatic Certificate Request Settings - New - Automatic Certificate Request*.

Figure 28: Group Policy Screen

77. When the Certificate Request Wizard appears, click *Next*.
78. Select *Computer*, then click *Next*.

Figure 29: Certificate Template Screen

79. Ensure that your certificate authority is checked, then click *Next*.
80. Review the policy change information and click *Finish*.
81. Click *Start - Run*, type `cmd` and press enter.
Enter `secedit /refreshpolicy machine_policy`
This command may take a few minutes to take effect.

82. Select *Start - Programs - Administrative Tools - Internet Authentication Service*
83. Right-click on *Clients*, and select *New Client*.

Figure 30: Service Screen

84. Enter a name for the access point, click *Next*.
85. Enter the address or name of the Wireless Access Point, and set the shared secret, as entered on the *Security Settings* of the Wireless Access Point.
86. Click *Finish*.
87. Right-click on *Remote Access Policies*, select *New Remote Access Policy*.
88. Assuming you are using EAP-TLS, name the policy eap-tls, and click *Next*.
89. Click *Add...*
If you don't want to set any restrictions and a condition is required, select *Day-And-Time-Restrictions*, and click *Add...*
- 90.

Figure 31: Attribute Screen

91. Click *Permitted*, then *OK*. Select *Next*.
92. Select *Grant remote access permission*. Click *Next*.
93. Click *Edit Profile...* and select the *Authentication* tab. Enable *Extensible Authentication Protocol*, and select *Smart Card or other Certificate*. Deselect other authentication methods listed. Click *OK*.

Figure 32: Authentication Screen

94. Select *No* if you don't want to view the help for EAP. Click *Finish*.

95. Select *Start - Programs - Administrative Tools- Active Directory Users and Computers*.
96. Double click on the user who you want to enable.
97. Select the *Dial-in* tab, and enable *Allow access*. Click *OK*.

Figure 33: Dial-in Screen

802.1x Client Setup on Windows XP

Windows XP ships with a complete 802.1x client implementation. If using Windows 2000, you can install Service Pack 3) to gain the same functionality.

If you don't have either of these systems, you must use the 802.1x client software provided with your wireless adapter. Refer to your vendor's documentation for setup instructions.

The following instructions assume that:

- You are using Windows XP
- You are connecting to a Windows 2000 server for authentication.
- You already have a login (User name and password) on the Windows 2000 server.

Client Certificate Setup

98. Connect to a network which doesn't require port authentication.

99. Start your Web Browser. In the *Address* box, enter the IP address of the Windows 2000 Server, followed by */certsrv*

e.g

http://192.168.0.2/certsrv

100. You will be prompted for a user name and password. Enter the *User name* and *Password* assigned to you by your network administrator, and click *OK*.

Figure 34: Connect Screen

101. On the first screen (below), select *Request a certificate*, click *Next*.

Figure 35: Wireless CA Screen

102. Select *User certificate request* and select *User Certificate*, then click *Next*.
- 103.

Figure 36: Request Type Screen

104. Click *Submit*.

Figure 37: Identifying Information Screen

105. A message will be displayed, then the certificate will be returned to you. Click *Install this certificate*.

Figure 38: Certificate Issued Screen

106. . You will receive a confirmation message. Click Yes.

Figure 39: Root Certificate Screen

107. Certificate setup is now complete.

802.1x Authentication Setup

108. Open the properties for the wireless connection, by selecting *Start - Control Panel - Network Connections*.

109. Right Click on the *Wireless Network Connection*, and select *Properties*.

110. Select the *Authentication* Tab, and ensure that *Enable network access control using IEEE 802.1X* is selected, and *Smart Card or other Certificate* is selected from the EAP type.

Figure 40: Authentication Tab

Encryption Settings

The Encryption settings must match the APs (Access Points) on the Wireless network you wish to join.

- Windows XP will detect any available Wireless networks, and allow you to configure each network independently.
- Your network administrator can advise you of the correct settings for each network. 802.1x networks typically use EAP-TLS. This is a dynamic key system, so there is no need to enter key values.

Enabling Encryption

To enable encryption for a wireless network, follow this procedure:

111. Click on the *Wireless Networks* tab.

Figure 41: Wireless Networks Screen

112. Select the wireless network from the *Available Networks* list, and click *Configure*.
113. Select and enter the correct values, as advised by your Network Administrator.
For example, to use EAP-TLS, you would enable *Data encryption*, and click the checkbox for the setting *The key is provided for me automatically*, as shown below.

Figure 42: Properties Screen

Setup for Windows XP and 802.1x client is now complete.

Using 802.1x Mode (without WPA)

This is very similar to using WPA-802.1x.

The only difference is that on your client, you must NOT enable the setting *The key is provided for me automatically*. Instead, you must enter the WEP key manually, ensuring it matches the WEP key used on the Access Point.

Figure 43: Properties Screen

Using WPA-PSK

For each of the following items, each Wireless Station must have the same settings as the Wireless Access Point.

Mode	On each PC, the mode must be set to Infrastructure .
SSID (ESSID)	This must match the value used on the Wireless Access Point. The default value is wireless Note! The SSID is case sensitive.
Wireless Security	On each client, Wireless security must be set to WPA-PSK. • The Pre-shared Key entered on the Access Point must also be entered on each Wireless client. • The Encryption method (e.g. TKIP, AES) must be set to match the Access Point.

Using WPA-802.1x

This is the most secure and most complex system.

802.1x mode provides greater security and centralized management, but it is more complex to configure.

Wireless Station Configuration

For each of the following items, each Wireless Station must have the same settings as the Wireless Access Point.

Mode	On each PC, the mode must be set to Infrastructure .
SSID (ESSID)	This must match the value used on the Wireless Access Point. The default value is wireless Note! The SSID is case sensitive.
802.1x Authentication	Each client must obtain a Certificate which is used for authentication for the Radius Server.
802.1x Encryption	Typically, EAP-TLS is used. This is a dynamic key system, so keys do NOT have to be entered on each Wireless station. However, you can also use a static WEP key (EAP-MD5); the Wireless Access Point supports both methods simultaneously.

Radius Server Configuration

If using **WPA-802.1x** mode, the Radius Server on your network must be configured as follow:

- It must provide and accept **Certificates** for user authentication.
- There must be a **Client Login** for the Wireless Access Point itself.
 - The Wireless Access Point will use its Default Name as its Client Login name. (However, your Radius server may ignore this and use the IP address instead.)
 - The *Shared Key*, set on the *Security Screen* of the Access Point, must match the *Shared Secret* value on the Radius Server.
- **Encryption** settings must be correct.

802.1x Server Setup (Windows 2000 Server)

This section describes using *Microsoft Internet Authentication Server* as the Radius Server, since it is the only Radius Server available that supports the EAP-TLS authentication method.

The following services on the Windows 2000 Domain Controller (PDC) are also required:

- dhcpd
- dns
- rras
- webserver (IIS)
- Radius Server (Internet Authentication Service)
- Certificate Authority

Windows 2000 Domain Controller Setup

114. Run *dcpromo.exe* from the command prompt.
115. Follow all of the default prompts, ensure that DNS is installed and enabled during installation.

Services Installation

116. Select the *Control Panel - Add/Remove Programs*.
117. Click *Add/Remove Windows Components* from the left side.
118. Ensure that the following components are activated (selected):
 - *Certificate Services*. After enabling this, you will see a warning that the computer cannot be renamed and joined after installing certificate services. Select *Yes* to select certificate services and continue
 - *World Wide Web Server*. Select *World Wide Web Server* on the *Internet Information Services (IIS)* component.
 - From the *Networking Services* category, select *Dynamic Host Configuration Protocol (DHCP)*, and *Internet Authentication Service* (DNS should already be selected and installed).

Figure 44: Components Screen

119. Click *Next*.
120. Select the *Enterprise root CA*, and click *Next*.

Figure 45: Certification Screen

121. Enter the information for the Certificate Authority, and click *Next*.

Figure 46: CA Screen

122. Click *Next* if you don't want to change the CA's configuration data.
 123. Installation will warn you that Internet Information Services are running, and must be stopped before continuing. Click *Ok*, then *Finish*.

DHCP server configuration

124. Click on the *Start - Programs - Administrative Tools - DHCP*
 125. Right-click on the server entry as shown, and select *New Scope*.

Figure 47: DHCP Screen

126. Click *Next* when the New Scope Wizard Begins.
127. Enter the name and description for the scope, click *Next*.
128. Define the IP address range. Change the subnet mask if necessary. Click *Next*.

Figure 48:IP Address Screen

129. Add exclusions in the address fields if required. If no exclusions are required, leave it blank. Click *Next*.
130. Change the *Lease Duration* time if preferred. Click *Next*.
131. Select *Yes, I want to configure these options now*, and click *Next*.
132. Enter the router address for the current subnet. The router address may be left blank if there is no router. Click *Next*.
133. For the Parent domain, enter the domain you specified for the domain controller setup, and enter the server's address for the IP address. Click *Next*.

New Scope Wizard

Domain Name and DNS Servers
The Domain Name System (DNS) maps and translates domain names used by clients on your network.

You can specify the parent domain you want the client computers on your network to use for DNS name resolution.

Parent domain:

To configure scope clients to use DNS servers on your network, enter the IP addresses for those servers.

Server name:	IP address:	
	192.168.0.250	Add
Resolve		Remove
		Up
		Down

< Back Next > Cancel

Figure 49: DNS Screen

134. If you don't want a WINS server, just click *Next*.
135. Select *Yes, I want to activate this scope now*. Click *Next*, then *Finish*.
136. Right-click on the server, and select *Authorize*. It may take a few minutes to complete.

137. Select *Start - Programs - Administrative Tools - Certification Authority*.
138. Right-click *Policy Settings*, and select *New - Certificate to Issue*.

Figure 50: Certificate Authority Screen

139. Select *Authenticated Session* and *Smartcard Logon* (select more than one by holding down the Ctrl key). Click *OK*.

Figure 51: Template Screen

140. Select *Start - Programs - Administrative Tools - Active Directory Users and Computers*.
141. Right-click on your active directory domain, and select *Properties*.

Figure 52: Active Directory Screen

142. Select the *Group Policy* tab, choose *Default Domain Policy* then click *Edit*.

Figure 53: Group Policy Tab

143. Select *Computer Configuration - Windows Settings - Security Settings - Public Key Policies*, right-click *Automatic Certificate Request Settings - New - Automatic Certificate Request*.

Figure 54: Group Policy Screen

144. When the Certificate Request Wizard appears, click *Next*.
145. Select *Computer*, then click *Next*.
- 146.

Figure 55: Certificate Template Screen

147. Ensure that your certificate authority is checked, then click *Next*.
148. Review the policy change information and click *Finish*.
149. Click *Start - Run*, type *cmd* and press enter.
Enter *secedit /refreshpolicy machine_policy*
This command may take a few minutes to take effect.

150. Select *Start - Programs - Administrative Tools - Internet Authentication Service*
151. Right-click on *Clients*, and select *New Client*.

Figure 56: Service Screen

152. Enter a name for the access point, click *Next*.
153. Enter the address or name of the Wireless Access Point, and set the shared secret, as entered on the *Security Settings* of the Wireless Access Point.
154. Click *Finish*.
155. Right-click on *Remote Access Policies*, select *New Remote Access Policy*.
156. Assuming you are using EAP-TLS, name the policy *eap-tls*, and click *Next*.
157. Click *Add...*

If you don't want to set any restrictions and a condition is required, select *Day-And-Time-Restrictions*, and click *Add...*

Figure 57: Attribute Screen

158. Click *Permitted*, then *OK*. Select *Next*.
159. Select *Grant remote access permission*. Click *Next*.
160. Click *Edit Profile...* and select the *Authentication* tab. Enable *Extensible Authentication Protocol*, and select *Smart Card or other Certificate*. Deselect other authentication methods listed. Click *OK*.

Figure 58: Authentication Screen

161. Select *No* if you don't want to view the help for EAP. Click *Finish*.

162. Select *Start - Programs - Administrative Tools- Active Directory Users and Computers*.
163. Double click on the user who you want to enable.
164. Select the *Dial-in* tab, and enable *Allow access*. Click *OK*.

Figure 59: Dial-in Screen

802.1x Client Setup on Windows XP

Windows XP ships with a complete 802.1x client implementation. If using Windows 2000, you can install Service Pack 3) to gain the same functionality.

If you don't have either of these systems, you must use the 802.1x client software provided with your wireless adapter. Refer to your vendor's documentation for setup instructions.

The following instructions assume that:

- You are using Windows XP
- You are connecting to a Windows 2000 server for authentication.
- You already have a login (User name and password) on the Windows 2000 server.

Client Certificate Setup

165. Connect to a network which doesn't require port authentication.

166. Start your Web Browser. In the *Address* box, enter the IP address of the Windows 2000 Server, followed by */certsrv*

e.g

http://192.168.0.2/certsrv

167. You will be prompted for a user name and password. Enter the *User name* and *Password* assigned to you by your network administrator, and click *OK*.

Figure 60: Connect Screen

168. On the first screen (below), select *Request a certificate*, click *Next*.

Figure 61: Wireless CA Screen

169. Select *User certificate request* and select *User Certificate*, then click *Next*.

Figure 62: Request Type Screen

170. Click *Submit*.

Figure 63: Identifying Information Screen

171. A message will be displayed, then the certificate will be returned to you. Click *Install this certificate*.

Figure 64:Certificate Issued Screen

172. . You will receive a confirmation message. Click Yes.
- 173.

Figure 65: Root Certificate Screen

174. Certificate setup is now complete.

802.1x Authentication Setup

175. Open the properties for the wireless connection, by selecting *Start - Control Panel - Network Connections*.
176. Right Click on the *Wireless Network Connection*, and select *Properties*.

177. Select the *Authentication* Tab, and ensure that *Enable network access control using IEEE 802.1X* is selected, and *Smart Card or other Certificate* is selected from the EAP type.

Figure 66: Authentication Tab

Encryption Settings

The Encryption settings must match the APs (Access Points) on the Wireless network you wish to join.

- Windows XP will detect any available Wireless networks, and allow you to configure each network independently.
- Your network administrator can advise you of the correct settings for each network. 802.1x networks typically use EAP-TLS. This is a dynamic key system, so there is no need to enter key values.

Enabling Encryption

To enable encryption for a wireless network, follow this procedure:

178. Click on the *Wireless Networks* tab.

Figure 67: Wireless Networks Screen

179. Select the wireless network from the *Available Networks* list, and click *Configure*.
180. Select and enter the correct values, as advised by your Network Administrator.
For example, to use EAP-TLS, you would enable *Data encryption*, and click the checkbox for the setting *The key is provided for me automatically*, as shown below.

Wireless Network Properties

Network name (SSID):

Wireless network key (WEP)

This network requires a key for the following:

- ☒ Data encryption (WEP enabled)
- ☐ Network Authentication (Shared mode)

Network key:

Key format:

Key length:

Key index (advanced):

☒ The key is provided for me automatically

☐ This is a computer-to-computer (ad hoc) network; wireless access points are not used

OK Cancel

Figure 68: Properties Screen

Setup for Windows XP and 802.1x client is now complete.

Using 802.1x Mode (without WPA)

This is very similar to using WPA-802.1x.

The only difference is that on your client, you must NOT enable the setting *The key is provided for me automatically*. Instead, you must enter the WEP key manually, ensuring it matches the WEP key used on the Access Point.

Figure 69: Properties Screen

Note:

On some systems, the "64 bit" WEP key is shown as "40 bit" and the "128 bit" WEP key is shown as "104 bit". This difference arises because the key input by the user is 24 bits less than the key size used for encryption.

Chapter 5

Operation and Status

This Chapter details the operation of the Wireless Access Point and the status screens.

Operation

Once both the Wireless Access Point and the PCs are configured, operation is automatic.

However, you may need to perform the following operations on a regular basis.

- If using the *Access Control* feature, update the *Trusted PC* database as required. (See *Access Control* in Chapter 3 for details.)
- If using 802.1x mode, update the *User Login* data on the Windows 2000 Server, and configure the client PCs, as required.

Status Screen

Use the **Status** link on the main menu to view this screen.

Status

Access Point

Access Point Name SC000012
 MAC Address 00:C0:02:00:00:12
 Domain Unspecified
 Firmware Version Version 2.0 Release 09

TCP/IP

IP Address 172.31.2.191
 Subnet Mask 255.255.255.0
 Gateway 172.31.2.252
 DHCP Client Enabled

Wireless

Channel/Frequency 1 (Automatic)
 Wireless Mode 802.11b and 802.11g
 AP Mode Access Point
 Bridge Mode None (disable)

Figure 70: Status Screen

Data - Status Screen

Access Point	
Access Point Name	The current name will be displayed.
MAC Address	The MAC (physical) address of the Wireless Access Point.
Domain	The region or domain, as selected on the Basic Wireless screen.
Firmware Version	The version of the firmware currently installed.
TCP/IP	
IP Address	The IP Address of the Wireless Access Point.
Subnet Mask	The Network Mask (Subnet Mask) for the IP Address above.
Gateway	Enter the Gateway for the LAN segment to which the Wireless Access Point is attached (the same value as the PCs on that LAN segment).
DHCP Client	This indicates whether the current IP address was obtained from a DHCP Server on your network. It will display "Enabled" or "Disabled".
Wireless	
Channel/Frequency	The Channel currently in use is displayed.
Wireless Mode	The current mode (e.g. 802.11g) is displayed.
AP Mode	The current Access Point mode is displayed.
Bridge Mode	The current Bridge mode is displayed.
Security Profiles	
Name	This displays the current name of each security profile.
SSID	This displays the SSID associated with the profile.
Status	This indicates whether or not the profile is enabled.
Buttons	
Statistics	Click this to open a sub-window where you can view Statistics on data transmitted or received by the Access Point.
Profile Status	Click this to open a sub-window which displays further details about each security profile.
Log	Click this to open a sub-window where you can view the activity log.
Stations	Click this to open a sub-window where you can view the list of all current Wireless Stations using the Access Point.

This screen is displayed when the *2.4GHz Statistics* button on the *Status* screen is clicked. It shows details of the traffic flowing through the Wireless Access Point.

Figure 71: Statistics Screen

Data - Statistics Screen

System Up Time	
System Up Time	This indicates how long the system has been running since the last restart or reboot.
2.4GHz Wireless	
Authentication	The number of "Authentication" packets received. Authentication is the process of identification between the AP and the client.
Deauthentication	The number of "Deauthentication" packets received. Deauthentication is the process of ending an existing authentication relationship.
Association	The number of "Association" packets received. Association creates a connection between the AP and the client. Usually, clients associate with only one (1) AP at any time.
Disassociation	The number of "Disassociation" packets received. Disassociation breaks the existing connection between the AP and the client.
Reassociation	The number of "Reassociation" packets received. Reassociation is the service that enables an established association (between AP and client) to be transferred from one AP to another (or the same) AP.
Wireless	
MSDU	Number of valid Data packets transmitted to or received from Wireless Stations, at application level.
Data	Number of valid Data packets transmitted to or received from Wireless Stations, at driver level.
Multicast Packets	Number of Broadcast packets transmitted to or received from Wireless Stations, using Multicast transmission.
Management	Number of Management packets transmitted to or received from Wireless Stations.
Control	Number of Control packets transmitted to or received from Wireless Stations.

The **Profile Status** screen is displayed when the *Profile Status* button on the Status screen is clicked.

Profile Status						
Name	SSID	Broadcast SSID	Security	Band	Status	Clients
wireless	wireless	Enable	None	2.4 GHz	Enabled	1
Profile02	wireless	Disable	None	2.4 GHz	Disabled	0
Profile03	wireless	Disable	None	2.4 GHz	Disabled	0
Profile04	wireless	Disable	None	2.4 GHz	Disabled	0
Profile05	wireless	Disable	None	2.4 GHz	Disabled	0
Profile06	wireless	Disable	None	2.4 GHz	Disabled	0
Profile07	wireless	Disable	None	2.4 GHz	Disabled	0
Profile08	wireless	Disable	None	2.4 GHz	Disabled	0

Refresh Close

Figure 72: Profile Screen

For each profile, the following data is displayed:

Name	The name you gave to this profile; if you didn't change the name, the default name is used.
SSID	The SSID assigned to this profile.
Broadcast SSID	Indicates whether or not the SSID is broadcast.
Band	The Wireless band (2.4 GHz or 5 GHz) used by this profile.
Status	Indicates whether or not this profile is enabled or currently used.
Clients	The number of wireless stations currently using accessing this Access Point using this profile. If the profile is disabled, this will always be zero.

This screen is displayed when the *Log* button on the *Status* screen is clicked.

Figure 73: Activity Log Screen

Data - Activity Log

Data	
Current Time	The system date and time is displayed.
Log	The Log shows details of the connections to the Wireless Access Point.
Buttons	
Refresh	Update the data on screen.
Save to file	Save the log to a file on your pc.
Clear Log	This will delete all data currently in the Log. This will make it easier to read new messages.

This screen is displayed when the *Stations* button on the *Status* screen is clicked.

Station List				
Name	MAC Address	Mode	SSID	Status
unknown	00:04:23:73:19:61	802.11b and 802.11g	wireless	Allow
Refresh				

Figure 74 Station List Screen

Data - Station List Screen

Station List	
Name	The name of each Wireless Station is displayed. If the name is not know, "unknown" is displayed for the name.
MAC Address	The MAC (physical) address of each Wireless Station is displayed.
Mode	The mode of each Wireless Station.
SSID	This displays the SSID used the Wireless station. Because the Wireless Access Point supports multiple SSIDs, different PCs could connect using different SSIDs.
Status	This indicates the current status of each Wireless Station.
Refresh Button	Update the data on screen.

Chapter 6

Access Point Management

This Chapter explains when and how to use the Wireless Access Point's "Management" Features.

Overview

This Chapter covers the following features, available on the Wireless Access Point's **Management** menu.

- Admin Login
- Auto Config/Update
- Config File
- Log Settings
- Rogue APs
- SNMP
- Upgrade Firmware

Admin Login Screen

The Admin Login screen allows you to assign a password to the Wireless Access Point. This password limits access to the configuration interface. The default password is *password*. It is recommended that this be changed, using this screen.

Admin Login

Login	User Name	admin
	☐ Change Admin Password New Password Repeat New Password	
Admin Connections	☒ Allow Admin connections via wired Ethernet only ☒ Enable HTTP Admin connections HTTP Port Number: 80	
	☐ Enable HTTPS (secure HTTP) Admin connections HTTPS Port Number: 443	
	☒ Enable Management via Telnet	
	Save Cancel Help	

Figure 75: Admin Login Screen

Data - Admin Login Screen

Login	
User Name	Enter the login name for the Administrator.
Change Password	Admin If you wish to change the Admin password, check this field and enter the new login password in the fields below.
New Password	Enter the desired login password.
Repeat New Password	Re-enter the desired login password.
Admin Connections	
Allow connections via wired Ethernet only	Admin If checked, then Admin connections via the Wireless interface will not be accepted.
Enable HTTP	Enable this to allow admin connections via HTTP. If enabled, you must provide a port number in the field below. Either HTTP or HTTPS must be enabled.
HTTP Port Number	Enter the port number to be used for HTTP connections to this device. The default value is 80.
Enable HTTPS	Enable this to allow admin connections via HTTPS (secure HTTP). If enabled, you must provide a port number in the field below. Either HTTP or HTTPS must be enabled.
HTTPS Port Number	Enter the port number to be used for HTTPS connections to this device. The default value is 443.
Enable Telnet	If desired, you can enable this option. If enabled, you will be able to connect to this AP using a Telnet client. You will have to provide the same login data (user name, password) as for a HTTP (Web) connection.

Auto Config/Update

The Auto Config/Update screen provides two (2) features:

- **Auto Config** - The Access Point will configure itself by copying data from another (compatible) Access Point.
- **Auto Update** - The Access Point will update its Firmware by downloading the Firmware file from your FTP Server.

Figure 76: Auto Config/Update Screen

Data - Auto Config/Update Screen

Admin Connections	
Perform Auto Configuration on this AP next restart	If checked, this AP will perform Auto Configuration the next time it restarts. • The wired LAN (NOT the Wireless LAN) will be searched for compatible APs. • If a compatible AP is found, its configuration is copied. If more than one compatible AP exists, the first one found is used. • Some data cannot be copied: - o The IP address is not copied, and will not change. - o The operating mode (Repeater, Bridge, etc) is not copied, and will not change. Note: This checkbox is automatically disabled, so the Auto-configuration is only performed once.
Respond to Auto-configuration request by other AP	If checked, this AP will respond to "Auto Configuration" requests it receives. If not checked, "Auto Configuration" requests will be ignored.
Provide login name and password	If enabled, the login name and password on this AP is supplied the the AP making the Auto-configuration request. If disabled, the AP making the Auto-configuration request will keep its existing login name and password.
Provide "Respond to Auto-configuration" setting	If enabled, the "Respond to Auto-configuration" setting on this AP is supplied the the AP making the Auto-configuration request. If disabled, the AP making the Auto-configuration request will keep its existing setting.

Auto Update	
Check for Firmware upgrade	If enabled, this AP will check to see if a Firmware (FW) upgrade is available on the specified FTP Server. If enabled: • Enter the desired time interval (in days) between checks. • Select the desired option for installation (see next item). • Provide the FTP server information.
Install...	Select the desired option: • Install FW if different version found If selected, then if the firmware file at the specified location is different to the current installed version, the FW will be installed. This allows "Downgrades" - installing an older version of the FW to replace the current version. • Install later version only If selected, then the firmware file at the specified location will only be installed if it is a later version.
FTP Server address	Enter the address (domain name or IP address) of the FTP Server.
Firmware pathname	Enter the full path (including the FW filename) to the the FW file on the FTP Server.
FTP Login Name	Enter the login name required to gain access to the FTP Server.
FTP Password	Enter the password for the login name above.

Config File

This screen allows you to Backup (download) the configuration file, and to restore (upload) a previously saved configuration file.

You can also set the Wireless Access Point back to its factory default settings.

To reach this screen, select *Config File* in the **Management** section of the menu.

Figure 77: Config File Screen

Data - Config File Screen

Backup	
Save a copy of current settings	Once you have the Access Point working properly, you should back up the settings to a file on your computer. You can later restore the Access Point's settings from this file, if necessary. To create a backup file of the current settings: • Click Back Up. • If you don't have your browser set up to save downloaded files automatically, locate where you want to save the file, rename it if you like, and click Save.
Restore	
Restore saved settings from a file	To restore settings from a backup file: 181. Click Browse . 182. Locate and select the previously saved backup file. 183. Click Restore
Defaults	
Revert to factory default settings	To erase the current settings and restore the original factory default settings, click Set to Defaults button. Note! • This will terminate the current connection. The Access Point will be unavailable until it has restarted. • By default, the Access Point will act as a DHCP client, and automatically obtain an IP address. You will need to determine its new IP address in order to re-connect.

Log Settings (Syslog)

If you have a Syslog Server on your LAN, this screen allows you to configure the Access Point to send log messages to your Syslog Server.

Syslog

Syslog Server

☒ Disable

☐ Broadcast

☐ Send to specified Syslog Server

Syslog Server Address: (Name/IP)

Minimum Severity Level:

Save Cancel Help

Figure 78: Log Settings (Syslog) Screen

Data - Log Settings Screen

Syslog Server	Select the desired Option: • Disable - Syslog server is not used. • Broadcast - Syslog data is broadcast. Use this option if different PCs act as the Syslog server at different times. • Send to specified Syslog Server - Select this if the same PC is always used as the Syslog server. If selected, you must enter the server address in the field provided.
Syslog Server Address	Enter the name or IP address of your Syslog Server.
Minimum Severity Level	Select the desired severity level. Events with a severity level equal to or higher (i.e. lower number) than the selected level will be logged.

Rogue APs

A "Rogue AP" is an Access Point which should not be in use, and so can be considered to be providing unauthorized access to your LAN.

This Access Point can assist to locate 2 types of Rogue APs:

- APs which have Wireless security disabled.
- APs which are not in the list of valid APs which you have provided.

When a Rogue AP is located, it is recorded in the log. If using SNMP, you can also choose to have detection of a Rogue AP generate an SNMP trap.

Figure 79: Rogue AP Detection Screen Data - Rogue AP Screen

Enable Detection	
Enable Detection	To use this feature, enable the "Enable Rogue AP Detection" checkbox, and select the desired wireless band and time interval.
Scan	Select the desired Wireless band to scan to Rogue APs and enter the desired time interval between each scan.
Detection generates SNMP Trap	If using SNMP, checking this option will cause a SNMP trap to be generated whenever a Rogue AP is detected. If not using SNMP, do not enable this option.
Rogue Detection	
No Security	If checked, then any AP operating with security disabled is considered to be a Rogue AP.
Not in Legal AP List	If checked, then any AP not listed in the "Legal AP List" is considered to be a Rogue AP. If checked, you must maintain the Legal AP List.
Define Legal AP List	Click this button to open a sub-screen where you can modify the "Legal AP List". This list must contain all known APs, so must be kept up to date.

SNMP

SNMP (Simple Network Management Protocol) is only useful if you have a SNMP program on your PC. On this screen, select *SNMP* in the **Management** section of the menu.

Figure 80: SNMP Screen

Data - SNMP Screen

General	
Enable SNMP	Use this to enable or disable SNMP as required
Community	Enter the community string, usually either "Public" or "Private".
Access Rights	Select the desired option: • Read-only - Data can be read, but not changed. • Read/Write - Data can be read, and setting changed.
Managers	
Any Station	The IP address of the manager station is not checked.
Only this station	The IP address is checked, and must match the address you enter in the IP address field provided. If selected, you must enter the IP address of the required station.
Traps	
Disable	Traps are not used.
Broadcast	Select this to have Traps broadcast on your network. This makes them available to any PC.
Send to	Select this to have Trap messages sent to the specified PC only. If selected, you must enter the IP Address of the desired PC.
Trap version	Select the desired option, as supported by your SNMP Management program.

Upgrade Firmware

The firmware (software) in the Wireless Access Point can be upgraded using your Web Browser. You must first download the upgrade file, and then select *Upgrade Firmware* in the **Management** section of the menu. You will see a screen like the following.

Firmware Upgrade

Upgrade File Locate and select the upgrade file from your hard disk:

Figure 81: Firmware Upgrade Screen

To perform the Firmware Upgrade:

184. Click the *Browse* button and navigate to the location of the upgrade file.
185. Select the upgrade file. Its name will appear in the *Upgrade File* field.
186. Click the *Upgrade* button to commence the firmware upgrade.

Note!

The Wireless Access Point is unavailable during the upgrade process, and must restart when the upgrade is completed. Any connections to or through the Wireless Access Point will be lost.

Appendix A

Specifications

Wireless Access Point

Hardware Specifications

CPU	AR2312
Radio-on-Chip	AR2112
DRAM	8 Mbytes
Flash ROM	2 Mbytes
LAN port	1 x Auto-MDIX RJ 45 for 10/100Mbps Ethernet
Wireless Interface	Embedded Atheros solution
	Network Standard IEEE 802.11b (Wi-Fi™) and IEEE 802.11g compliance
	OFDM; 802.11b: CCK (11 Mbps, 5.5 Mbps), DQPSK (2 Mbps), DBPSK (1 Mbps)
	Operating Frequencies 2.412-2.497 GHz
	Operating Channels 802.11g: 13 for North America, 13 for Europe (ETSI), 14 for Japan
	802.11b: 11 for North America, 14 for Japan, 13 for Europe (ETSI)
Operating temperature	0~55°C
Storage temperature	-20°C~70°C
Power Adapter	24VDC 500ma
Dimensions	141mm (W) x 100mm (D) x 27mm (H)

Wireless Specifications

Receive Sensitivity at 11Mbps	min. -85dBm
Receive Sensitivity at 5.5Mbps	min. -89dBm
Receive Sensitivity at 2Mbps	min. -90dBm
Receive Sensitivity at 1Mbps	min. -93dBm

Maximum Receive Level	min. -5dBm
Transmit Power	18 dBm
Modulation	Direct Sequence Spread Spectrum BPSK / QPSK / CCK
Throughput	Up to 19 Mbps
Operating Range	Indoors • 30 Meters (100ft.) @ 11Mbps • 50 Meters (165ft.) @ 5.5Mbps • 70 Meters (230ft.) @ 2Mbps • 91 Meters (300ft.) @ 1Mbps Outdoors • 152 Meters (500ft.) @ 11Mbps • 270 Meters (885ft.) @ 5.5Mbps • 396 Meters (1300ft.) @ 2 Mbps • 457 Meters (1500ft.) @ 1 Mbps

Software Specifications

Feature	Details
Wireless	• Access point support • Roaming supported • IEEE 802.11g/11b compliance • Supper G (up to 108Mbps) • Auto Sensing Open System / Share Key authentication • Wireless Channels Support • Automatic Wireless Channel Selection • Antenna selection • Tx Power Adjustment • Country Selection • Preamble Type: long or short support • RTS Threshold Adjustment • Fragmentation Threshold Adjustment • Beacon Interval Adjustment • SSID assignment
Operation Mode	• Common AP, Client/Repeater AP • Peer-to-Peer Bridge, Point-to-Multi-Point Bridge Bridge mode can be used simultaneously with Common AP mode.
Security	• Open, shared, WPA, and WPA-PSK authentication • 802.1x support • EAP-TLS, EAP-TTLS, PEAP • Block inter-wireless station communication • Block SSID broadcast
Management	• Web based configuration • RADIUS Accounting • RADIUS-On feature • RADIUS Accounting update • CLI • Message Log • Access Control list file support

	• Configuration file Backup/Restore
	• Statistics support • Device discovery program • Windows Utility
Other Features	• DHCP client • WINS client
Firmware Upgrade	HTTP, FTP network protocol download

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation.

This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

To assure continued compliance, any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment. (Example - use only shielded interface cables when connecting to computer or peripheral devices).

FCC Radiation Exposure Statement

This equipment complies with FCC RF radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with a minimum distance of 20 centimeters between the radiator and your body.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:

- (1) This device may not cause harmful interference, and
 - (2) this device must accept any interference received, including interference that may cause undesired operation.
- This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

Appendix B

Troubleshooting

Overview

This chapter covers some common problems that may be encountered while using the Wireless Access Point and some possible solutions to them. If you follow the suggested steps and the Wireless Access Point still does not function properly, contact your dealer for further advice.

General Problems

Problem 1: Can't connect to the Wireless Access Point to configure it.

Solution 1: Check the following:

- The Wireless Access Point is properly installed, LAN connections are OK, and it is powered ON. Check the LEDs for port status.
- Ensure that your PC and the Wireless Access Point are on the same network segment. (If you don't have a router, this must be the case.)
- If your PC is set to "Obtain an IP Address automatically" (DHCP client), restart it.
- You can use the following method to determine the IP address of the Wireless Access Point, and then try to connect using the IP address, instead of the name.

To Find the Access Point's IP Address

187. Open a MS-DOS Prompt or Command Prompt Window.

188. Use the Ping command to "ping" the Wireless Access Point. Enter ping followed by the Default Name of the Wireless Access Point.
e.g.

ping SC003318

189. Check the output of the ping command to determine the IP

Figure 82: Ping

If your PC uses a Fixed (Static) IP address, ensure that it is using an IP Address which is compatible with the Wireless Access Point. (If no DHCP Server is found, the Wireless Access Point will default to an IP Address and Mask of 192.168.0.228 and 255.255.255.0.) On Windows PCs, you can use *Control Panel-Network* to check the *Properties* for the TCP/IP protocol.

Problem 2: My PC can't connect to the LAN via the Wireless Access Point.

Solution 2

Check the following:

- The SSID and WEP settings on the PC match the settings on the Wireless Access Point.
- On the PC, the wireless mode is set to "Infrastructure"
- If using the *Access Control* feature, the PC's name and address is in the *Trusted Stations* list.
- If using 802.1x mode, ensure the PC's 802.1x software is configured correctly. See Chapter 4 for details of setup for the Windows XP 802.1x client. If using a different client, refer to the vendor's documentation.

Technical Support

Enable-IT OEM Technical Support is available directly to registered distributors and prospective customers.

Online Technical Services

Enable-IT, Inc. Technical Support is available via e-mail at support@enableit.com

World Wide Web Site

Enable-IT, Inc. Technical Support is available via the Internet at http://www.ethernetextender.com/contact_us.php

Returning Products for Warranty Repair

Enable-IT, Inc. warrants to the original purchaser of the Product ("you" or the "End User") that, for the one (1) year period commencing on the date the Product was purchased (the "Warranty Period"), the Product will be substantially free from defects in materials and workmanship under normal use and conditions. Electrical damage is not an item that is covered under this warranty or extended warranties. Optional two (2) year and three (3) year warranties are available to extend this coverage if purchased during the first year of coverage.

If authorized by Enable-IT to return a Product which does not conform to the warranty set forth above, the End User must: (1) obtain a return materials authorization (RMA) number from Enable-IT by contacting the Customer Service Dept. at 888-309-0910 between the hours of 8:00 a.m. and 5:00 p.m. PST and otherwise fully comply with Enable-IT's then-current RMA policy; (2) return the Product to Enable-IT, Inc. in its original packaging freight pre-paid; and (3) provide to Enable-IT the original receipt or bill of sale establishing the date on which the Product was purchased.

Please ship Authorized RMAs to:

Enable-IT Processing Facility
16600 Harbor Blvd, Ste G
Fountain Valley, CA 92708

Returning Products for Refund

30-Day refund applies to single kit Ethernet Extenders only and is subject to a 25% Restocking Fee. Shipments without valid / authorized RMA number or sent to our corporate Las Vegas Address can be refused and or billed for additional shipping.

Enable-IT Limited Warranty

Enable-IT warrants the Enable-IT 8424 WiFi AP Units solely pursuant to the following terms and conditions.

1. PRODUCT WARRANTY

a. Express Warranty Enable-IT warrants to the original purchaser of the Product ("you" or the "End User") that, for the one (1) year period commencing on the date the Product was purchased (the "Warranty Period"), the Product will be substantially free from defects in materials and workmanship under normal use and conditions. This warranty does not apply to Products which are resold as used, repaired or reconditioned or consumables (such as batteries) supplied with the Product. Enable-IT does not make any warranty with respect to any third party product, software or accessory supplied with or used in connection with the Product and such third party products, software and accessories, if any, are provided "AS IS." Warranty claims related to such third party products, software and accessories must be made to the applicable third party manufacturer.

b. Remedies for Breach of Warranty In the event of a breach of the foregoing warranty, Enable-IT will, in its sole discretion and at its cost and subject to the terms of the following paragraph, repair the non-conforming Product, replace the non-conforming Product with a new or reconditioned Product or refund of the purchase price for the Product. Any new or reconditioned Product provided pursuant to this paragraph is warranted as provided herein for the remainder of the original Warranty Period. THE REMEDY SET FORTH IN THIS PARAGRAPH SHALL BE THE END USER'S SOLE AND EXCLUSIVE REMEDY FOR BREACH OF THE FOREGOING WARRANTY.

c. Conditions for Warranty Qualification If authorized by Enable-IT to return a Product which does not conform to the warranty set forth above, the End User must: (1) obtain a return materials authorization (RMA) number from Enable-IT by contacting the Customer Service Dept. at 888-309-0910 between the hours of 8:00 a.m. and 5:00 p.m. PST and otherwise fully comply with Enable-IT's then-current RMA policy; (2) return the Product to Enable-IT in its original packaging freight pre-paid; and (3) provide to Enable-IT the original receipt or bill of sale establishing the date on which the Product was purchased.

Products returned to Enable-IT without an RMA number will be returned to the End User. Enable-IT shall not be responsible for damage or loss during shipment of the returned Product to Enable-IT.

d. Voiding of Warranty. The express warranty set forth above shall not apply to failure of the Product if the Product has been subjected to: (i) physical abuse, misuse, improper installation, abnormal use, power failure or surge, or use not consistent with the operating instructions provided by Enable-IT; (ii) modification (including but not limited to opening the Product housing) or repair by any party in any manner other than as approved by Enable-IT in writing; (iii) fraud, tampering, unusual physical or electrical stress, unsuitable operating or physical conditions, negligence or accidents; (iv) removal or alteration of the Product serial number tag; (v) improper packaging of Product returns; or (vi) damage during shipment (other than during the original shipment of the Product to the End User from Enable-IT, if applicable).

e. Warranty Disclaimers THE EXPRESS WARRANTY SET FORTH ABOVE IS IN LIEU OF ALL OTHER WARRANTIES, WHETHER WRITTEN, ORAL, EXPRESS OR IMPLIED. ENABLE-IT DISCLAIMS, TO THE MAXIMUM EXTENT PERMITTED BY LAW, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NONINFRINGEMENT OF THIRD PARTY RIGHTS. NO PERSON (INCLUDING WITHOUT LIMITATION, ENABLE-IT' EMPLOYEES, AGENTS, RESELLERS, OEMS OR DISTRIBUTORS) IS AUTHORIZED TO MAKE ANY OTHER WARRANTY OR REPRESENTATION CONCERNING THE PRODUCT. IF THE DISCLAIMER OF ANY IMPLIED WARRANTY IS NOT PERMITTED BY LAW, THE DURATION OF ANY SUCH IMPLIED WARRANTY IS LIMITED TO ONE (1) YEAR FROM THE DATE OF PURCHASE. SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OF IMPLIED WARRANTIES OR LIMITATIONS ON HOW LONG AN IMPLIED WARRANTY MAY LAST, SO SUCH LIMITATIONS OR EXCLUSIONS MAY NOT APPLY. THIS WARRANTY GIVES THE END USER SPECIFIC LEGAL RIGHTS AND THE END USER MAY ALSO HAVE OTHER RIGHTS WHICH VARY FROM JURISDICTION TO JURISDICTION. ENABLE-IT DOES NOT WARRANT THAT THE OPERATION OF THE PRODUCT WILL BE UNINTERRUPTED OR ERROR FREE. ENABLE-IT IS NOT RESPONSIBLE FOR ANY DAMAGE TO OR LOSS OF ANY PROGRAMS, DATA, OR OTHER INFORMATION STORED ON OR TRANSMITTED USING THE PRODUCT.

2. LIMITATION OF LIABILITY IN NO EVENT SHALL ENABLE-IT BE LIABLE TO THE END USER OR ANY THIRD PARTY FOR ANY INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL OR CONSEQUENTIAL DAMAGES IN CONNECTION WITH OR ARISING OUT OF THE SALE OR USE OF THE PRODUCT (INCLUDING BUT NOT LIMITED TO LOSS OF PROFIT, USE, DATA, OR OTHER ECONOMIC ADVANTAGE), HOWEVER IT ARISES, INCLUDING WITHOUT LIMITATION BREACH OF WARRANTY, OR IN CONTRACT OR IN TORT (INCLUDING NEGLIGENCE), OR STRICT LIABILITY, EVEN IF ENABLE-IT HAS BEEN PREVIOUSLY ADVISED OF THE POSSIBILITY OF SUCH DAMAGE AND EVEN IF A LIMITED REMEDY SET FORTH IN THIS AGREEMENT FAILS OF ITS ESSENTIAL PURPOSE. IN NO EVENT SHALL ENABLE-IT' LIABILITY TO THE END USER OR ANY THIRD PARTY EXCEED THE PRICE PAID FOR THE PRODUCT. BECAUSE SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OR LIMITATION OF LIABILITY FOR CONSEQUENTIAL OR INCIDENTAL DAMAGES, THE ABOVE LIMITATIONS MAY NOT APPLY TO THE END USER.

3. LICENSE AND LIMITATIONS. The firmware and software embedded in the Product (the "Embedded Software") are licensed to you. Your use of the Product is your acceptance of the warranty terms above and the terms below. You may use the Embedded Software solely in

conjunction with your use of the Product. All worldwide right, title and interest in and to the Product, or any portion thereof (including but not limited to the Embedded Software),

including all copyrights, patent rights, trademarks, trade secrets, and other intellectual property rights therein and thereto, are and shall remain the exclusive property of Enable-IT and/or its licensors. You acknowledge and agree that you may not, and may not allow any third party to, (i) use the Embedded Software in a manner that is inconsistent with the above express right granted to you or (ii) modify, distribute, reproduce, decompile, disassemble, reverse engineer or otherwise attempt to discover the source code for the Embedded Software.
